

Hurricane Protection For Medical Campus...

HPI installs perforated metal barrier systems that provide outstanding passive protection for hurricanes and added security. Quality, see-thru perforated 14-gauge stainless steel barriers were built to withstand 190 mph Category 5 hurricane wind gusts and are permanently installed without conflicting with the design aesthetics present in the architecture of the campus.

Hurricane Protection Industries expert professionals partnered with the client's project team and architects in developing effective solutions for severe storm mitigation. We are especially skilled in retrofit applications for hospitals, universities, essential facilities and shelters.

Architectural services and construction management for project provided by RO Architects + Planners, Inc.

Top left photos 1 & 2: HPI engineered, fabricated the mounting structure and installed see-thru passive barriers in 14-gauge perforated stainless steel above an extensive atrium area to provide Category 5 hurricane protection as well as added shade. The arched glass atrium skylight barrier covers 3,700 square feet.

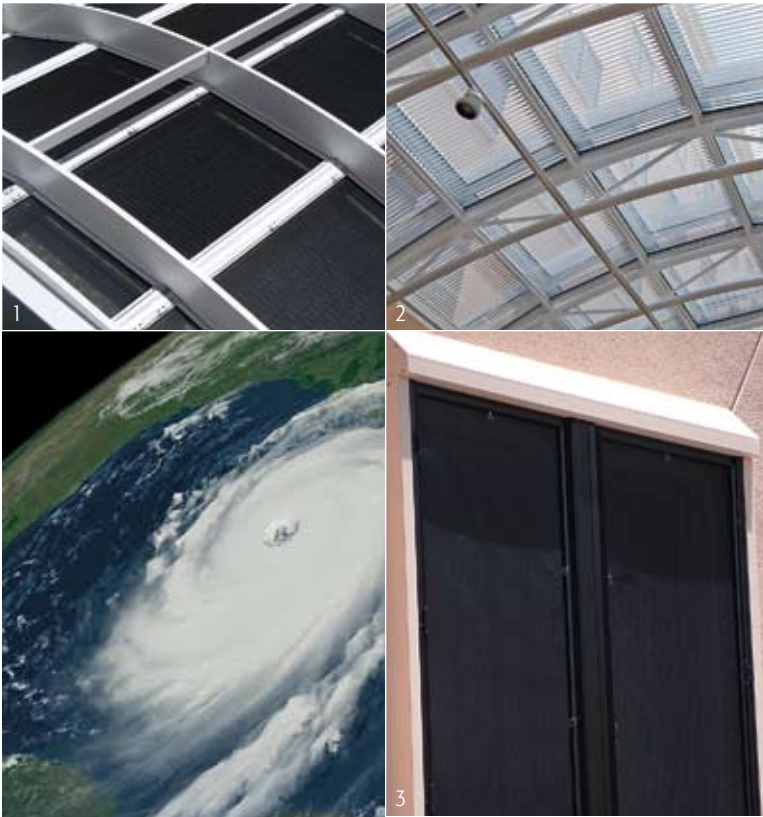

Photo 3: HPI worked with the owner's project team and architects to create a cost-effective yet highly pleasing window protection solution that would blend and complement existing shutter housings located elsewhere on campus buildings.

Photos above: The Baptist Health Main Hospital Campus project is a retrofit, consisted of several phases involving multi-month job site coordination with tenants and others in multiple buildings. Products used in the project in addition to the perforated metal barriers include roll downs, accordion shutters and flexible screen wind abatement systems. In all, over 23,500 square feet of openings and special areas are protected. HPI, as a general contractor and leading innovator, is expert at providing the resources and best solutions to meld design aesthetics, cost, security and outstanding protection for your project.
